SUMMARY

Senior Software Engineer who works from **first principles** — analysis, system design, and problem-solving — not from any single language or framework. **An engineer who owns systems end-to-end — not an entry-level coder.** Across **6+ years** I've owned software **end-to-end** (analysis → design → development → integration → testing → deployment → production support) and adopted whatever technology each problem demanded — native mobile, **Django** backends, **Next.js** web, real-time systems, and **multi-agent AI**. I engineer and operate production products, including **Abber — 21,000+ users**, **57,000+ orders**, **600K+ real-time messages**, run **6+ months in production with zero downtime**. I enter any domain on demand and ship production-grade systems, accelerated by **AI-assisted workflows**.

CORE COMPETENCIES

Engineering Method: first-principles analysis · system design · problem-solving · algorithms & data structures · **rapid entry into any language, stack, or domain** · clean code

Languages: Java · **Python** · **Node.js** · TypeScript / JavaScript · Dart · SQL · Kotlin · Swift — principles over any single language

System Lifecycle: requirements & systems analysis · architecture & solution design · development · integration · testing / QA · deployment · production support · continuous improvement

Systems, Integration & Vendors: REST / JSON APIs · webhooks · OAuth 2.0 / JWT · third-party & vendor system integration · payment-gateway integration · data reconciliation · WebSocket · WebRTC

Payments & Fintech: HyperPay · Tap · Tamara · Mada · STC Pay · Apple Pay · Google Pay · PayPal · Visa · Mastercard · Stripe · 3D Secure · tokenization · reconciliation

Backend & Distributed Systems: Python · Django · Django REST Framework · Node.js · PostgreSQL · MySQL · Celery · Redis · **distributed systems · microservices · REST APIs · query & performance optimization · scalability**

Infrastructure, Support & IT Operations: Docker · AWS S3 · Firebase · CI/CD · Sentry monitoring · incident detection & troubleshooting · new-system implementation

Applications & Interfaces: Flutter · Flutter Web · Next.js / TypeScript · Swift · Kotlin · admin dashboards & operational reporting

Leadership & Governance: technical leadership · architecture reviews · engineering standards · **AI-assisted development (Claude Code · Cursor · Copilot · Codex · Gemini)** · automation & multi-agent systems

PROFESSIONAL EXPERIENCE

Senior Software Engineer & Technical Lead — Somow

Buraydah, Saudi Arabia · somow.sa | May 2022 – Present

Promoted from Flutter Developer to Senior Software Engineer & Technical Lead, taking on increasing responsibility for Somow's production products (Abber, Wisal, Azbah).

- Own systems **end-to-end** — from requirements and analysis through design, development, integration, testing, deployment, and production support.
- **Reduced QA-reported defects by 50%** by establishing engineering standards, code review, and production monitoring.
- **Improved the technology operating model and delivery efficiency** by bringing outsourced engineering work in-house.
- Act as the **technical point of contact for external technology providers** — managing integrations, API/SDK requirements, technical troubleshooting, testing, and production issues across payment gateways and other third-party services (Tamara, Meta, Huawei, and others).
- **Led weekly architecture reviews** for a 4–6 engineer team and authored the internal Clean Architecture handbook adopted across the team.

- Prepare and submit Somow's **government tender bids on Etimad** (RFP analysis, compliance matrices, technical and financial proposals); built a **multi-agent AI pipeline** that drafts them.
- Build and operate production systems on **Django** (REST APIs, real-time via Channels/Daphne, Celery/Redis jobs, Docker) covering orders, payments, accounting, wallets, and helpdesk; integrated dozens of external services and provide ongoing production support (Sentry, Crashlytics).

Earlier Experience — Independent / Freelance
Remote | 2019 – 2022

- **Flutter Developer (2021–2022):** cross-platform apps with REST integrations, shipped to the App Store and Google Play.
- **Android Developer (2019–2020):** production Android apps (Java) for clients — from requirements to Play Store release.

SELECTED PRODUCTION SYSTEMS

Systems across **very different domains**, starting with the **Somow products** I own and operate:

Abber — Dream & Vision Interpretation Marketplace (App Store · Google Play · abber.co). Own the design, development, and ongoing operation of a production platform connecting users with vetted interpreters — serving **21,000+ users** with **57,000+ orders** and **600K+ real-time messages** delivered across mobile/web apps, backend services, live sessions, and third-party integrations — spanning ~30 business domains (orders, accounting, payments, wallets, helpdesk).

Wisal — Consultation Marketplace (App Store · Google Play · wisalapp.com). Own and operate a marketplace connecting users with verified vendors via paid orders, chat, and **VoIP calls** — backed by a wallet and a real **double-entry accounting** engine on a Django backend.

Azbah — Group Expense-Splitting & Settle-Up (App Store · Google Play · azbah.somow.sa). Own and operate a settle-up app where members share expenses and settle inter-member claims via wallet or cash, on a strict **double-entry accounting** ledger (Django REST / PostgreSQL) with an operations admin panel.

Independent products & systems:

Maskani — Social Real-Estate Platform (maskani.homes). Connect property owners directly with clients — listings, services, jobs, a social feed, requests, and real-time chat — delivered across three stacks: a Flutter app, an internal admin app, and a Next.js/TypeScript web app on a Dockerized Django backend.

Wasselak — Express-Delivery Platform (GitHub). A multi-app delivery platform on a **Django backend** — customer, delivery-captain, business, employee, and admin apps plus a web dashboard — with real-time GPS tracking over WebSocket and optimized REST APIs.

FactForge — Multi-Agent AI System. A **Python multi-agent** pipeline that autonomously researches, produces, and publishes educational videos end-to-end (idea → script → fact-check → TTS → render → publish) to YouTube and social platforms.

OPEN SOURCE & ENGINEERING CREDIBILITY

- **video_compressor_plus** (pub.dev) — native-encoder video compression (no FFmpeg, no app-size bloat); a maintained continuation adding Swift Package Manager support.
- **flutter_websocket_manager** (pub.dev) — production WebSocket manager, **155 / 160 pub points**, cross-platform.
- **solar_community_icons** (pub.dev) — Founder & Maintainer; 2,500+ icons, **160 / 160 pub points**.
- **shared_utils** — internal Flutter framework reused across all production apps: typed networking, WebSocket/SSE managers, persistent device identity, formatters, and media pickers.
- Published under the **ardev.dev** publisher · **7.6M+ lines of authored code** across **133 repositories** and **12 product ventures** at github.com/ardev-dev.

EDUCATION & LANGUAGES

Education: Bachelor of Information Technology — Software Engineering, International University of Africa, Khartoum (Graduated Nov 2024). Publishing production software since 2019 — Android, then Flutter from 2021 — in parallel with studies.

Languages: Arabic — Native · English — Working Proficiency.
